2.3 Remote Wire Communication Function

2.3.1 Remote Dimming

All output specifications are reported as a percentage of the full ballast rating,

EXP: 80% of 630W ballast =504W.

Output Mapping Equation (W): (Dimming ratio)*ballast rating=Output.

Note: 1.Dimming accuracy is 3%(as per the output power of $V_{mains} = 220V$).

when the dimming ratio is 0%, the ballast will be off ;

user can set the parameters show in the 80%-100%.

2.3.2 Remote Control Function

- ✧ It can control remotely the ballast's on/off/dimming rate.
- ✧ Group control mode:it can control the state of a set of products .
- ✧ Single lamp control mode : it can control the state of a single product.
- ✧ Sun rise and set :When the SR/SS set time is 0min, the ballast will power on/off as its own speed, actually, it's exactly same as Power on/off.

2.4 Protection

2.4.1 Open Circuit Protection

When output is shut off, the ballast will power off for open circuit protection. When errors are removed and the power is re-applied to the product, it can work normally.

2.4.2 Short Circuit Protection

When output is shorted, the ballast will power off for short circuit protection. When errors are removed and the power is re-applied to the product, it can work normally.

2.4.3 Over Temperature Protection

When $T_a > 40^\circ\text{C}$, the ballast will shut off for high temperature protection. When the temperature drops to normal and the power is re-applied to the product, it can work normally.

2.4.4 Lamp END of Life/Rectification

The ballast will be not damaged when the rectification appears at the end of the lamp life. When replacing a new lamp and the power is re-applied, it can work normally.

2.4.5 Over-voltage/ Low-voltage Detect Protection

Protection happens when input voltage is below 175V or up to 275V (Output power will drop to 80% when input voltage is 175-195V). When input voltage is back to normal, the ballast can work normally.

Note: Voltage accuracy is 3%.

2.4.6 LED status

Status	LED
Output lock down	Flash*1
*Output errors	Flash*2
Low input voltage	Flash*3
Over temperature	Flash*4
High input voltage	Flash*5
Lamp fault	Flash*6

*LED status only as a remind of product's fault, when the output have a failure, please check the status of the kind of fault.

Note: when the controller is controlled, LED(controller) flashes 2 times every 2S, When the controller is no contacted or connection failed, LED(controller) is lighting, if the 3min is still no control signal, "controller" flash, the product is shut down.
